

Triumeq: Partial Dispensing, Unit-Dose Repackaging, and Temperature Stability

Storage, Partial Dispensing, and Unit-Dose Packaging

Triumeq
(abacavir/dolutegravir/
lamivudine
[ABC/DTG/3TC]) tablets
should be stored and
dispensed in the original
package, protected from
moisture, and with the
bottle tightly closed. Do not
remove the desiccant from
the bottle.¹

ABC/DTG/3TC tablets
are moisture-sensitive
and the product stability
is linked to the presence
of moisture.
ABC/DTG/3TC tablets
should not be
repackaged into unit-
dose blister packages.

Once opened,
ABC/DTG/3TC tablets
may be dispensed up to
the expiration date that
is stamped on the
container, as long as the
desiccant is present and
still intact.

ViiV Healthcare cannot
recommend the use of
product that is stored or
dispensed outside of
the original packaging
or product that has
been stored without the
desiccant.

Supplemental Temperature Stability Data

The following studies were conducted in HDPE bottles with child resistant closures and induction seal liners. The bottles contained 30 tablets and included a two-gram silica gel desiccant. This container is identical to the commercial HDPE bottle used to ship and store ABC/DTG/3TC tablets.²

High Temperature Stability

- Studies that evaluated temperature stability excursions showed that ABC/DTG/3TC was stable at 30° C (86° F) and 75% RH for up to 36 months.²
- Further data indicated that temperatures of 40° C (104° F) / 75% RH for up to 6 months and temperatures of 50° C (122° F) at ambient humidity for up to 3 months found **no significant change** in stability.²

Low Temperature Stability

- A 28-day freeze-thaw study evaluated ABC/DTG/3TC under alternating freezing conditions of -20° C (-4° F) for seven days, then 30° C (86° F) for seven days (two cycles each), found **no significant change** in stability.²
